Abstract The purpose of this study was to determine if there were differences in the prevalence of risk factors associated with low back pain between two groups of nurses. One group consisted of nurses who had no history of low back pain and the other group consisted of nurses who had a history of low back pain. A questionnaire was distributed to all participants asking them to report their demographic information, work-related variables, and self-reported health status. Results showed that there were significant differences between the two groups in terms of age, years of experience, type of nursing unit, and frequency of lifting or moving patients. There were also significant differences in the prevalence of some risk factors such as smoking, alcohol consumption, and depression. The findings suggest that there are differences in the prevalence of risk factors associated with low back pain between the two groups of nurses.

Abstract

Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 40 to 50 years old, who were randomly assigned to a 12-week training program or a control group. The training program consisted of three sessions per week, each lasting 30 minutes, of low-intensity aerobic exercise. The control group remained sedentary. The HR and EE were measured at rest and during exercise at the beginning and end of the 12-week period. The results showed that the training program had a significant effect on the HR and EE of the subjects. The HR and EE were significantly higher in the training group than in the control group at the end of the 12-week period. The results suggest that a 12-week training program can improve the cardiovascular fitness and energy expenditure of sedentary, middle-aged women.

The chemical structure of 1,2-bis(4-methylphenyl)ethane-1,2-diol (BMDA) is shown. It consists of a central ethane-1,2-diol moiety where each hydroxyl group is substituted with a 4-methylphenyl group. The structure is symmetrical, with two phenyl rings connected by a central carbon-carbon bond, and each ring having a methyl group at the para position relative to the ether linkage.

The graph displays the annual number of infectious disease cases in the Republic of Serbia. The data shows a dramatic increase in 1991, reaching nearly 100,000 cases. This is followed by a steep decline in 1992 to approximately 20,000 cases. From 1993 onwards, the number of cases remains relatively low, fluctuating between 10,000 and 20,000 per year, with a slight upward trend in the late 1990s.
